09-B2

BST Application

kd-Tree: 2D

凡见字数，如停匀，即平分一半为上卦，一半为下卦。如字数不均，即少一字为上卦，取天轻清之义，以多一字为下卦，取地重浊之义

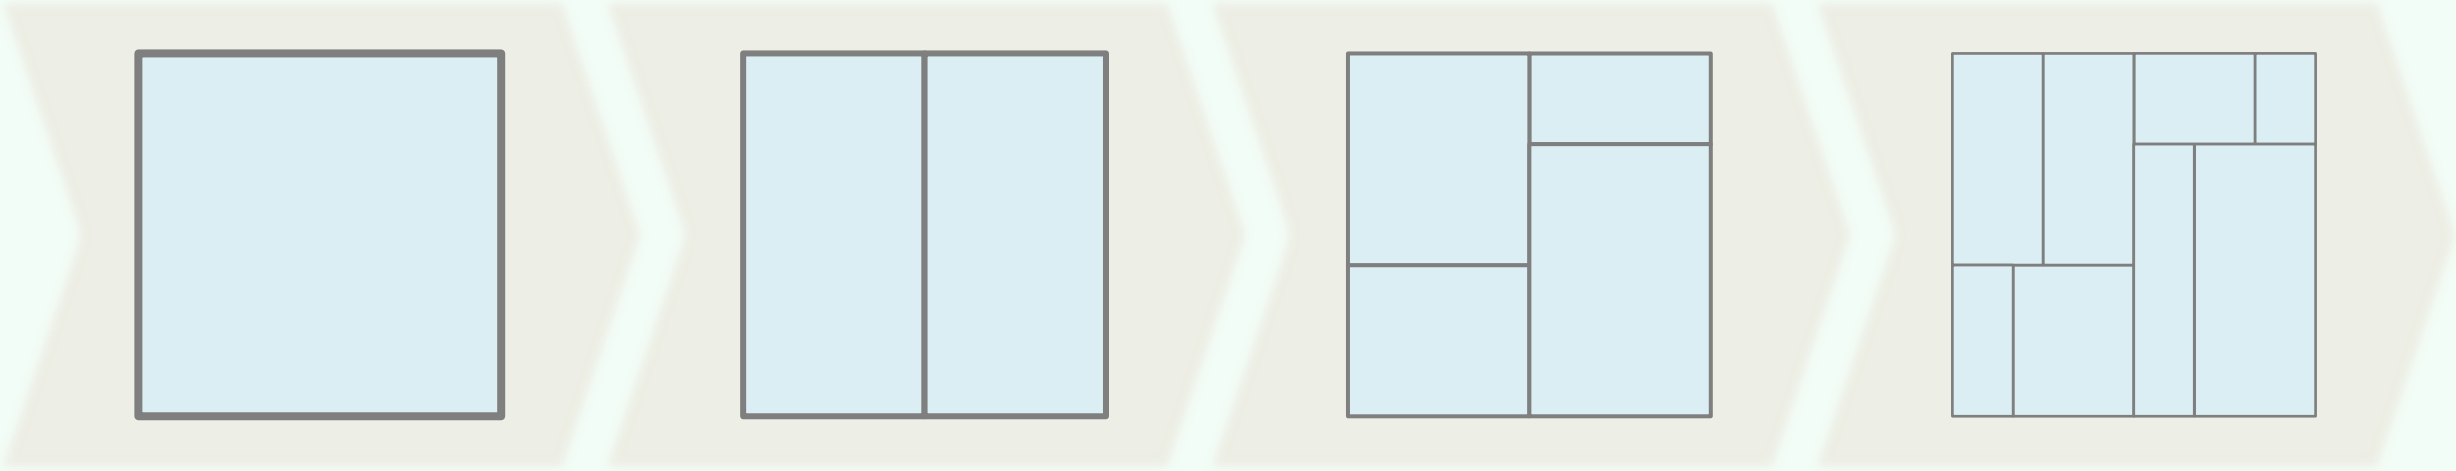
Divide-And-Conquer

- To extend the BBST method to planar GRS, we
  - divide the plane recursively and
  - arrange the regions into a kd-tree
- Start with a single region (the entire plane)

  Partition the region vertically/horizontally on each even/odd level

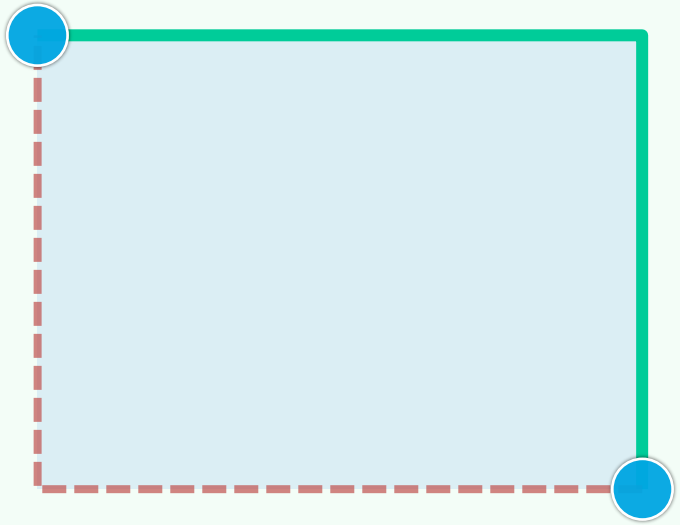
  Partition the sub-regions recursively

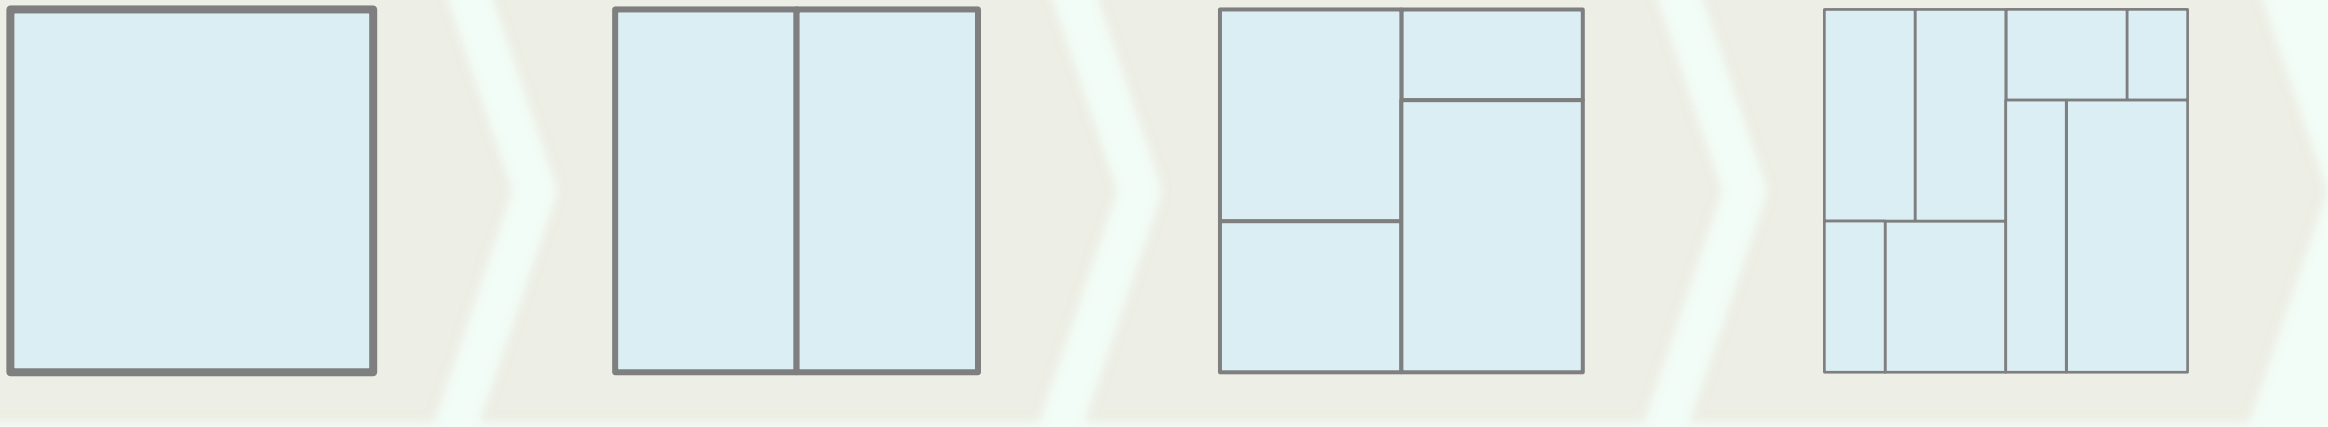


More Details

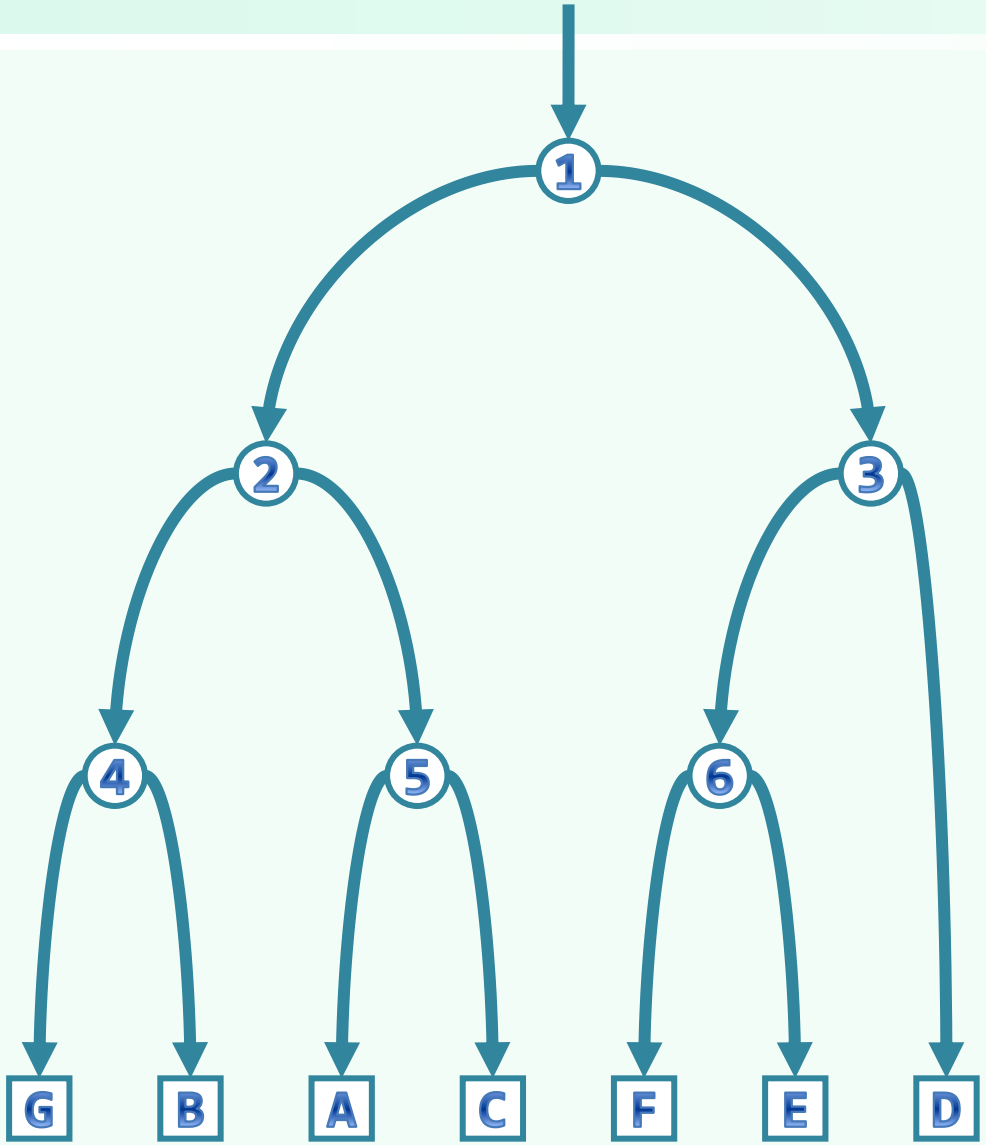
❖ To make it work,

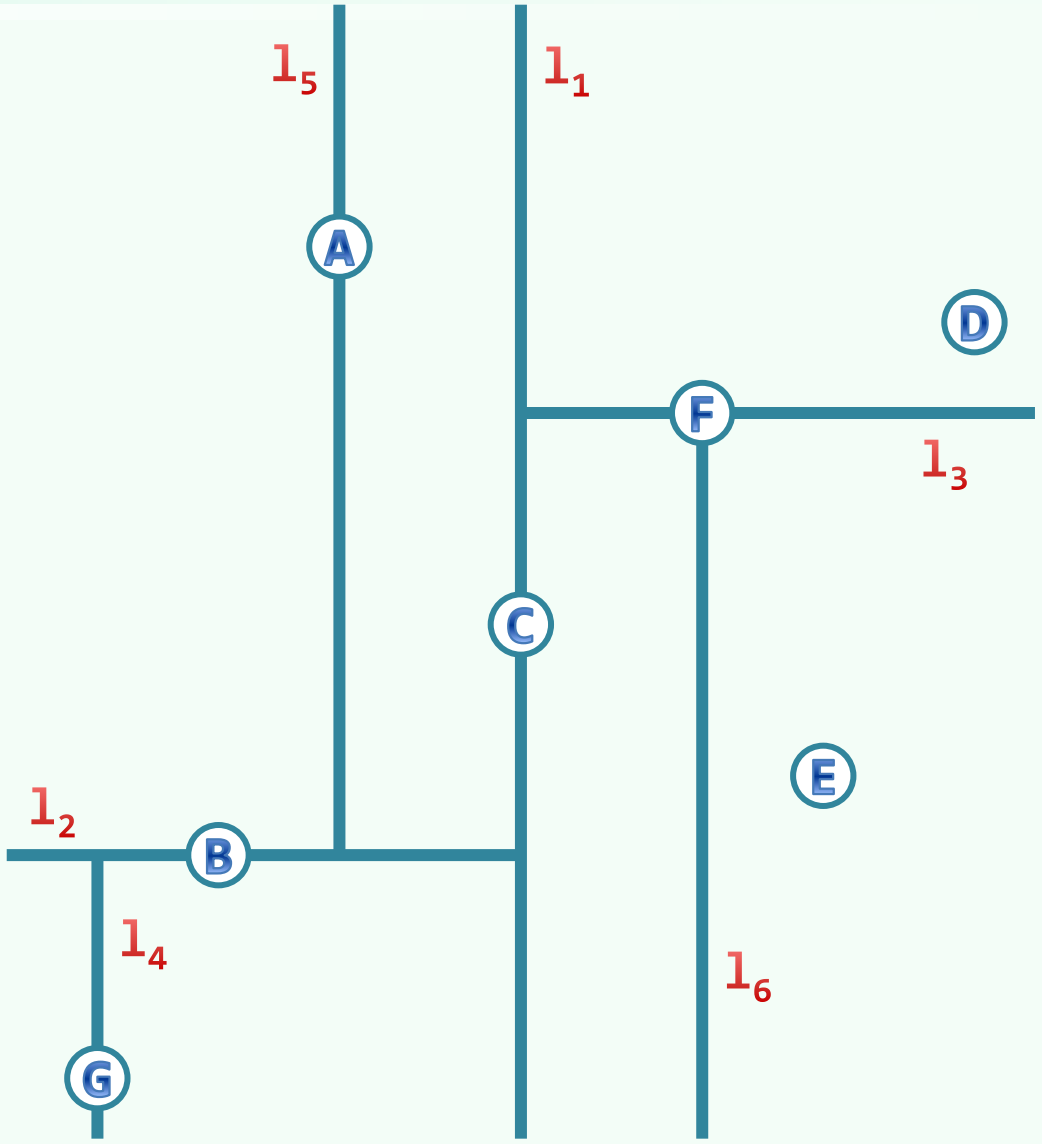
- each partition should be done as evenly as possible (at median)
- each region is defined to be open/closed on the left-lower/right-upper sides





Example





Quadtree
